BIA Metallic

The concrete brick with a metal layer.

Concrete bricks are available in eight sorts of metal.

BIA Metallic is a concrete brick with a metal covering which is available in eight different sorts of metal: zinc, brass, bronze, copper, aluminium, iron, nickel and stainless steel. The bricks are treated with a cold spray metal. The treated surface of the brick consists of 95% metal. This gives an overall impression of solid metal.

Where is BIA Metallic brick used in practice?

BIA Metallic bricks are suitable for interior and exterior use. BIA Metallic can be used to enhance projects where metal components are a feature of the building. The bricks can be used around door frames, openings in walls or around windows.

Concrete stronger with metal

Once the product has been treated it has all the qualities of solid metal in texture, appearance and heat conductivity, but without the weight and cost. BIA Metallic is a durable product which does not chip or peel. During the production of the metal spray a chemical reaction occurs between the metal and hybrid polymer binder and this transforms the two metals into an all new composite metal. As a result of the process the product becomes stronger.
